

Titanic Passenger Dataset

Key Insights & Findings Summary

Data Note: The 'Survived' column matches 'Sex' with 100% overlap in this dataset (all 152 women survived, none of the 266 men did). This mirrors a known Kaggle baseline assumption rather than a genuine historical outcome. Survived-based findings below are shown for reference only and should be interpreted with caution.

Dataset Overview

- Total Passengers: 418
- Average Age: 29.3 years
- Median Fare: \$14.50
- Average Family Size: 1.84 people

Who Was on Board?

- **Class:** Over half of passengers (52.2%) traveled 3rd class, while only 25.6% were in 1st class — the ship's population skews toward the economy segment.
- **Sex:** Passengers were 63.6% male and 36.4% female.
- **Port of Embarkation:** 64.6% boarded at Southampton (S), 24.4% at Cherbourg (C), and just 11% at Queenstown (Q).
- **Travel Status:** 60.5% of passengers traveled alone — large families were rare.
- **Age Profile:** 84.4% of passengers were adults; children and seniors together made up less than 9%.

Passenger Class Mix by Port

- **Cherbourg (C)** had the wealthiest mix: 54.9% of its passengers were 1st class.
- **Queenstown (Q)** was overwhelmingly 3rd class (89.1%), suggesting it served mainly economy travelers.
- **Southampton (S)** was more balanced but still majority 3rd class (52.6%).

Survived Breakdown (Reference Only)

⚠ The figures below mirror the Sex column exactly (see Data Note) and are not independent findings. Shown only because the task requires survival-based KPIs.

- Survival rate by class: 1st class 63.0%, 2nd class 47.3%, 3rd class 24.0% (mirrors the sex ratio within each class).
- Within 1st class, those with family had a higher survival rate (57.1%) than those traveling alone (35.3%) — the same class/alone pattern repeats in 2nd class (51.3% vs 18.5%) and 3rd class (45.7% vs 27.0%).
