

WWI Sales Analysis: Key Insights

1. Overall Sales & Profit Performance The business is doing very well. Total sales reached 20M with a profit of 9.92M, which means a high profit margin of 49.92%. There are 8,000 orders in total, and an average order is worth about 2,500 units.

Sales grew steadily from 2013 to 2015 and almost doubled. The data for 2016 only shows the first five months (Jan–May). Because of this, sales look lower in 2016, but this is just because the year is not finished yet. The profit margin stayed at around 50% every year, showing that the company grows efficiently.

- **Recommendation:** Since 2016 data is incomplete, compare full-year estimates instead of partial data so managers do not think sales are dropping.

2. Salesperson Performance Most sales come from a small group of salespeople. The top salesperson (ID: 19) sells much more than anyone else.

Note: The dataset only shows salesperson IDs, not their actual names.

- **Recommendation:** Find out how the top sellers work and share their methods with the rest of the team. Also, connect the CRM system to see real names instead of IDs.

3. Geographic Distribution (City Key) Sales are concentrated in a few main cities. Like the salesperson data, we only have `City Key` numbers instead of real city names.

4. Product Performance — Overview The best-selling item is the *Air Cushion Machine*. Packaging materials (like bubble wraps) make up most of the Top 10 list, so a large part of the income comes from packaging items.

Almost all items (96.79%) are sold individually under the "Each" category. Other package types like Packet, Pair, or Bag make up only a tiny part of overall sales.

5. Loss-Making Products — Critical Finding 566 sales entries (about 2% of all sales) made a loss, costing the company -40,502 in total. This loss comes from 18 different products.

However, almost all of this loss comes from just one product group: *Halloween Zombie Mask (Light Brown)*. Its 4 size variations cause 87% of all loss-making sales and 82% of the total money lost. The company loses money on **every single sale** of this mask because it sells for 18, but costs 19 to make. This is a clear pricing mistake. The other 14 products only cause small, accidental losses.

- **Recommendation:** Fix the price of the Halloween Zombie Mask immediately (raise it to at least 19 or higher to make a profit). This simple change will save about 33,000 every year.
